

Same 86 % / 14 % client-size skew in both panels — only the class structure differs

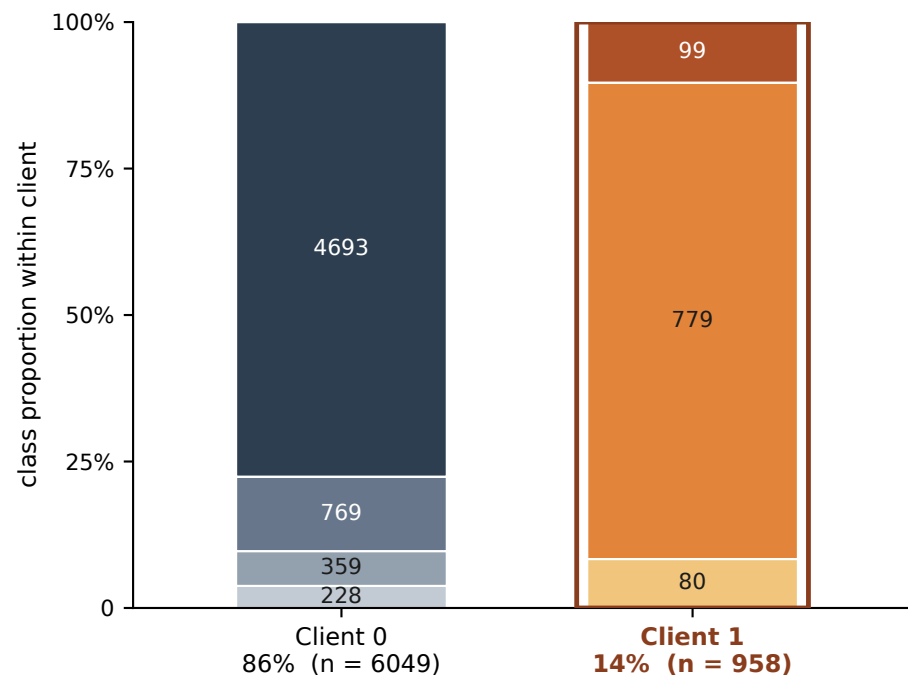

L1 — quantity skew only

near-global class mix on both clients

L4 — class-disjoint partition

rare-class signal isolated on Client 1

JS divergence ≈ 0

class mixtures near-identical $\rightarrow$ pure size skew

akiec bcc bkl df mel vasc nv

JS divergence = 1

class supports disjoint $\rightarrow$ label skew added

grey = common classes

amber = rare-class set {df, mel, vasc}

slate = majority (mel-nevi)
