

Per-(round, client) local-epoch schedules under the three system-heterogeneity conditions (seed 42; deterministic given seed)

(a) C0 -- no system heterogeneity
all clients $E = 20$ every round

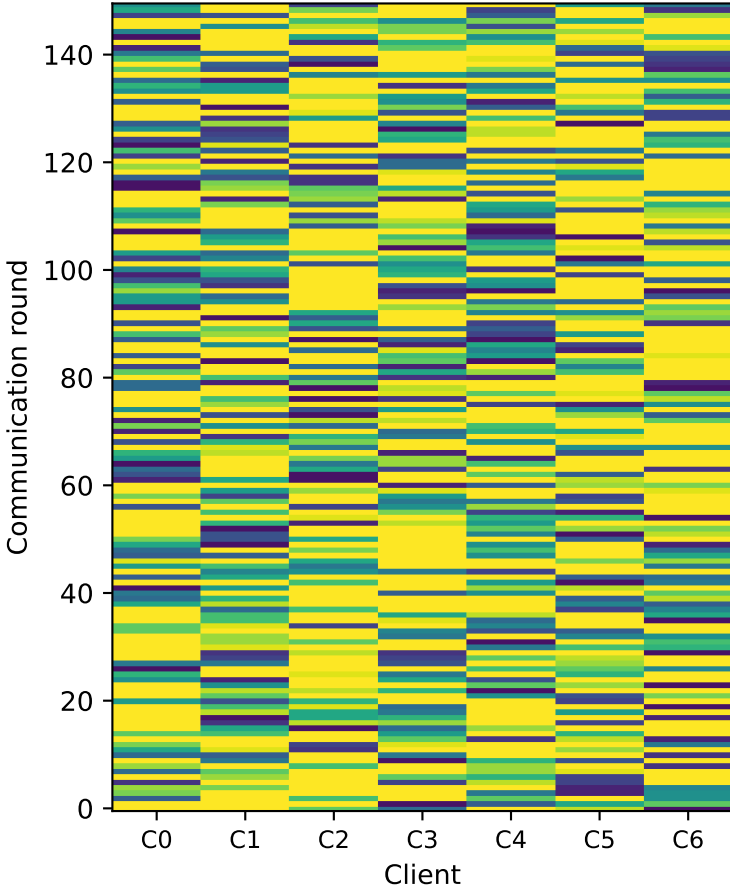

straggler cells: 0/1050 (0%), mean $E = 20.00$

(b) C1 -- fixed stragglers
C5, C6 always $E = 5$

straggler cells: 300/1050 (29%), mean $E = 15.71$

(c) C2 -- random stragglers (primary)
4/7 clients per round, $E \sim U\{1..19\}$

straggler cells: 600/1050 (57%), mean $E = 14.14$
