

Per-class validation F1 over rounds (pure-PyTorch headline, $n = 10$ paired seeds, mean $\pm$ SEM)

Notes:

Mean $\pm$ SEM across 10 paired seeds, pure-PyTorch, engineered partition.

Melanoma (centre row, right): only class with Holm-corrected significant Δ ($\Delta = +0.114$, $p_{\text{Holm}} = 0.04$).

Melanocytic nevi (majority class) shows essentially no FedProx gap — held by every client in the engineered partition.
